Code of Conduct

- Microsoft's mission is to empower every person and every organization on the planet to achieve more. This includes at this event, where we seek to create a respectful, friendly, and inclusive experience for all participants. As such, we do not tolerate harassing or disrespectful behavior, messages, images, or interactions by any event participant, in any form, at any aspect of the program including business and social activities, regardless of location.
- We do not tolerate any behavior that is degrading to any gender, race, sexual orientation or disability, or any behavior that would violate Microsoft's Anti-Harassment and Anti-Discrimination Policy, Equal Employment Opportunity Policy, or Standards of Business Conduct. In short, the entire experience must meet our culture standards.
- We encourage everyone to assist in creating a welcoming and safe environment. Please report any concerns, harassing behavior, suspicious or disruptive activity directly to us. Microsoft reserves the right to refuse admittance to or remove any person from this and/or future events at any time in its sole discretion.

Contents

- What are good serverless architectures?
- Successful architecture patterns
- Operational responsibilities
- Scaling factors and guidelines
- Cost implications
- Containers and Serverless
- Platform engineering

Who am i?

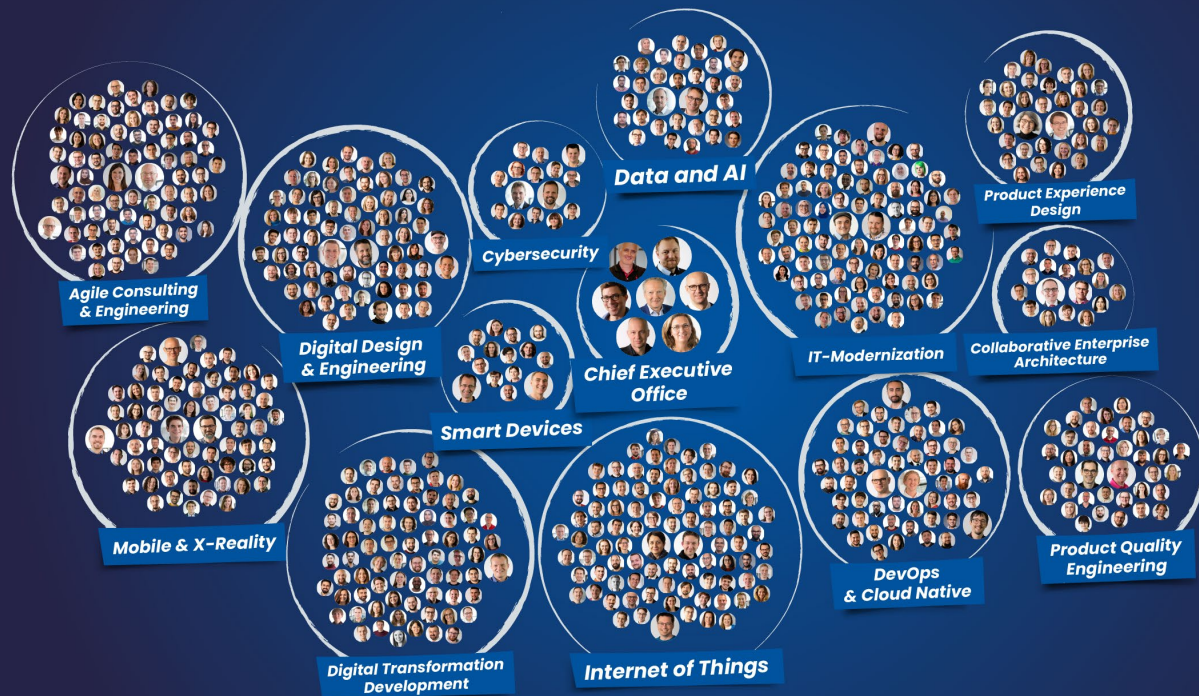

Christian Leinweber

- „Principal Architect“ @ MaibornWolff
- I live with my wife and my 3 kids near to Lüneburg
- I'm work at the Hamburg Office Location
- Me and my team build cloud-native applications
- We use serverless wherever it makes sense
- A lot of these projects focus on IoT systems

 @christle_hh

- High investment in **Research & Development**
- More than 800 employees worldwide
- Locations: München, Augsburg, Darmstadt, Frankfurt, Berlin, Hamburg, Tunis, Valencia
- **12th consecutive year Great Place To Work**

**With dedication to deliver
and a passion for technology**

Domain driven components on fine grained Application Architectures

A lot of applications make use of a hexagonal pattern. Why?

The **amount**
of **external**
ressources
keep growing

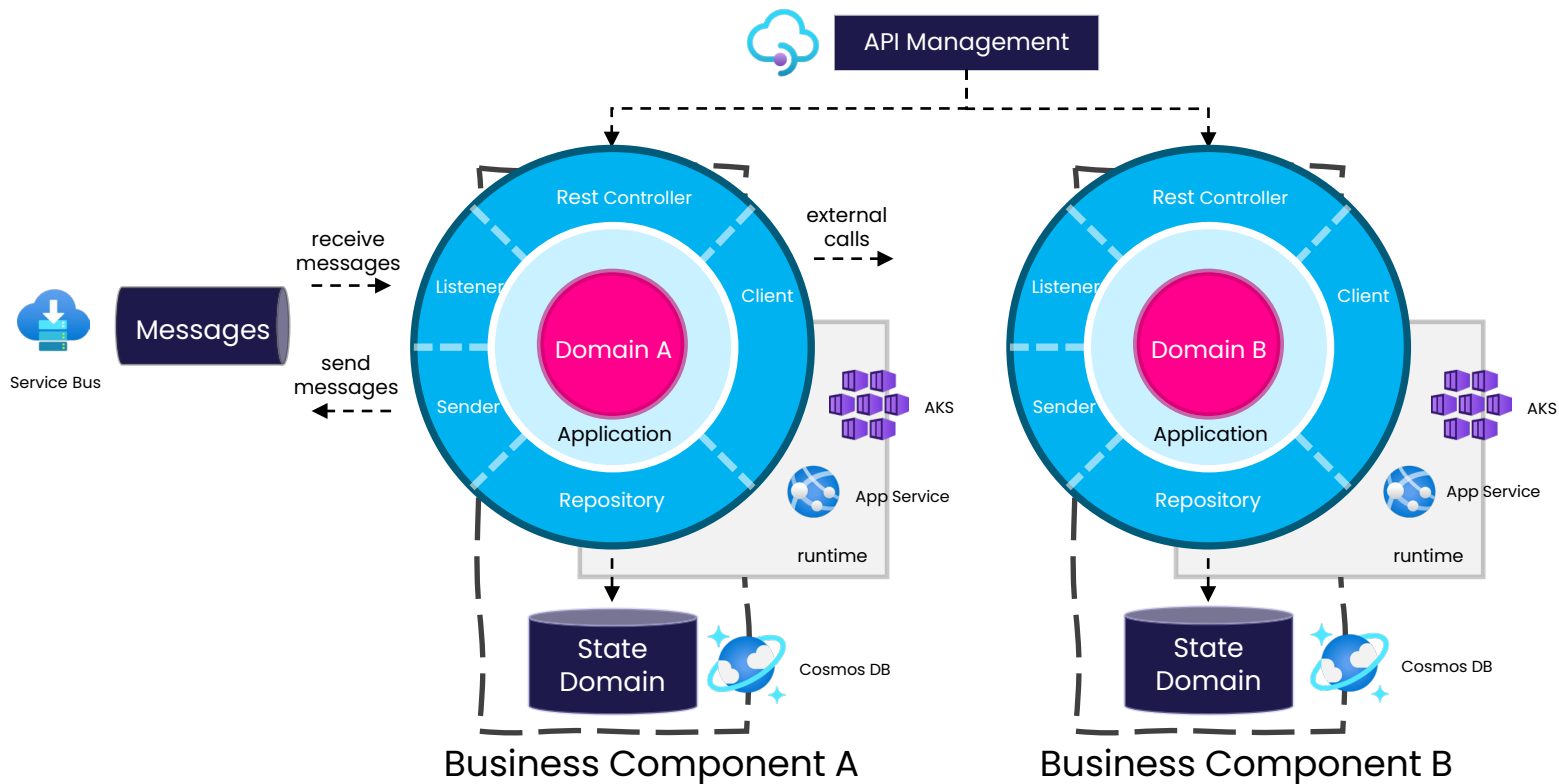

An **hexagonal**
architcecture
type support
this **very well**

A very
domain
orientated
approach

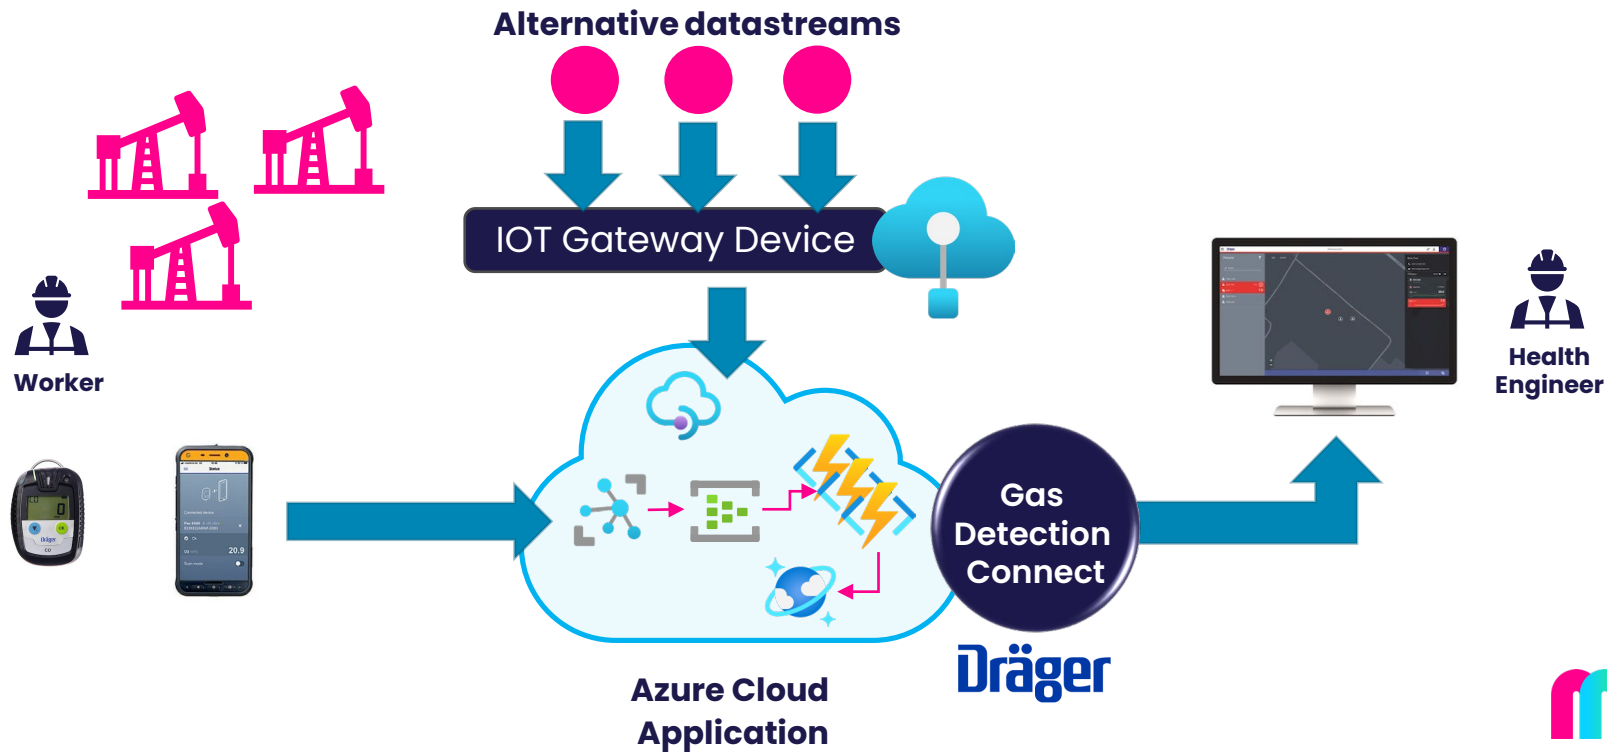

Domain driven components on fine grained Application Architectures

Hexagonal patterns work well with classic microservices

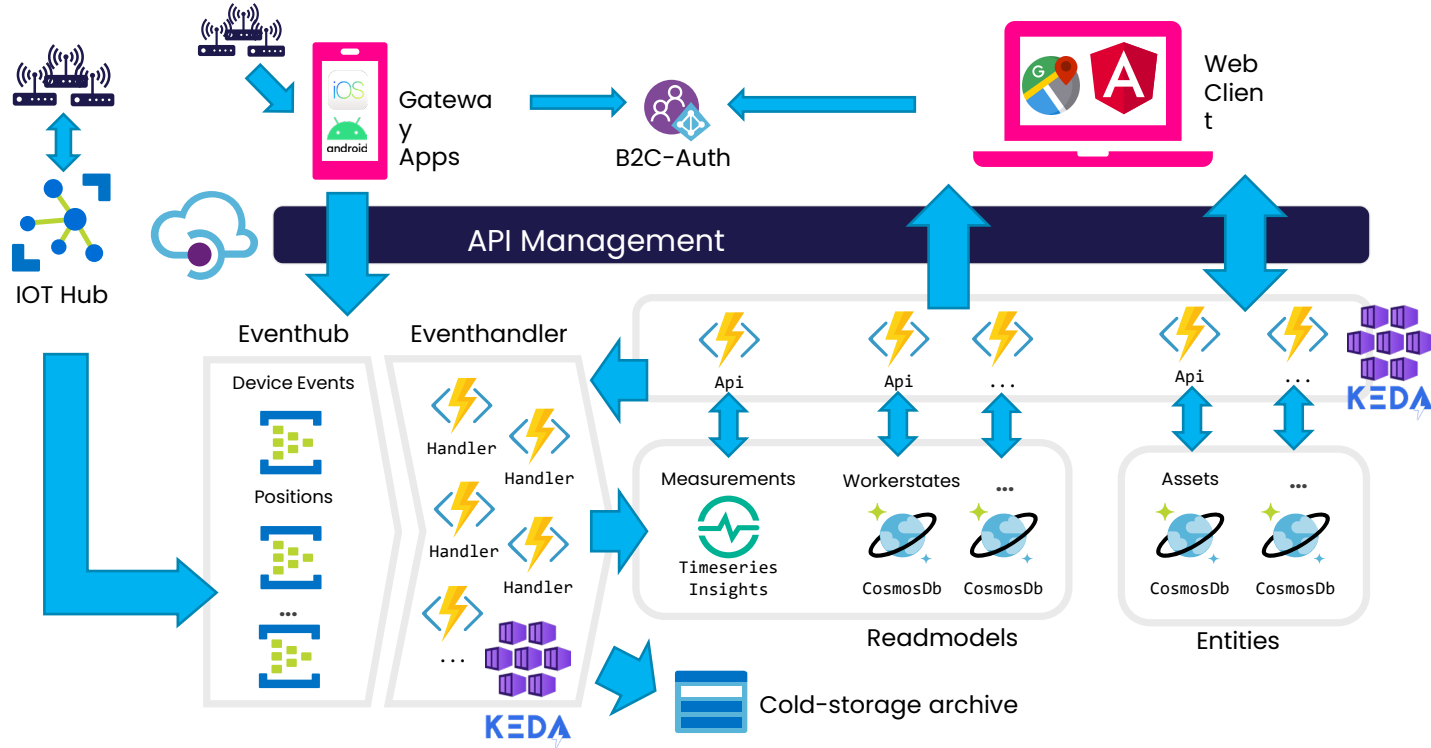

Domain driven components on fine grained Application Architectures

Current customer example based on serverless

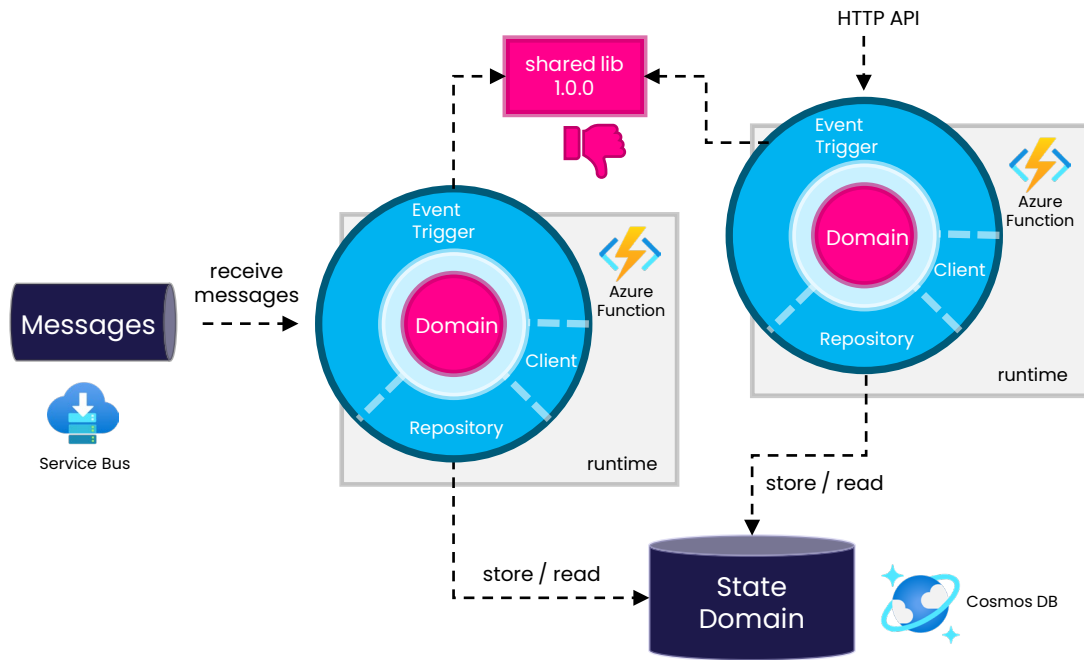

Early solution draft based on Azure Functions

Domain driven components on fine grained Application Architectures

Using a Domain driven project setup in Azure Functions

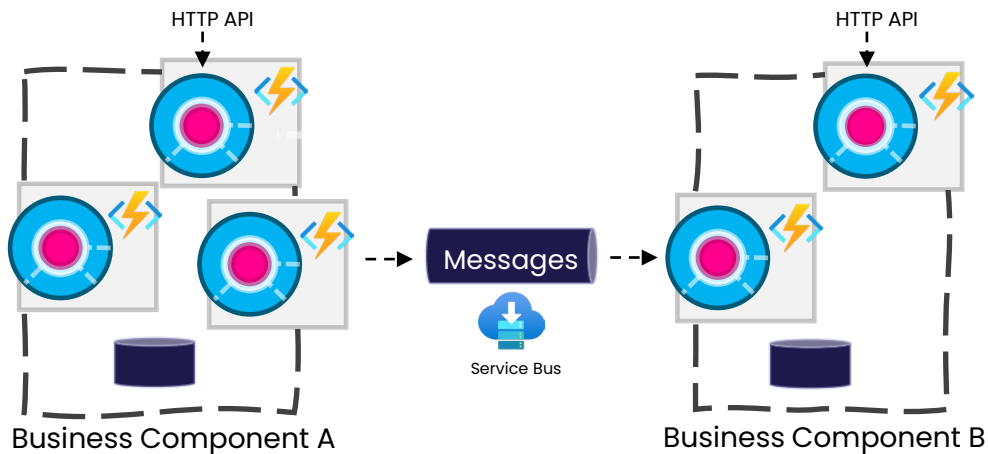

Technical motivation
for an system
cut and not a
business
perspective

2 domain
cores leading
to **code
duplications**
and more
dependencies

A **shared
versioned
model lib** is
even for
microservices
an **anti-
pattern**

Use common microservice rules for virtual components

**Only one
datastore
per virtual
component**

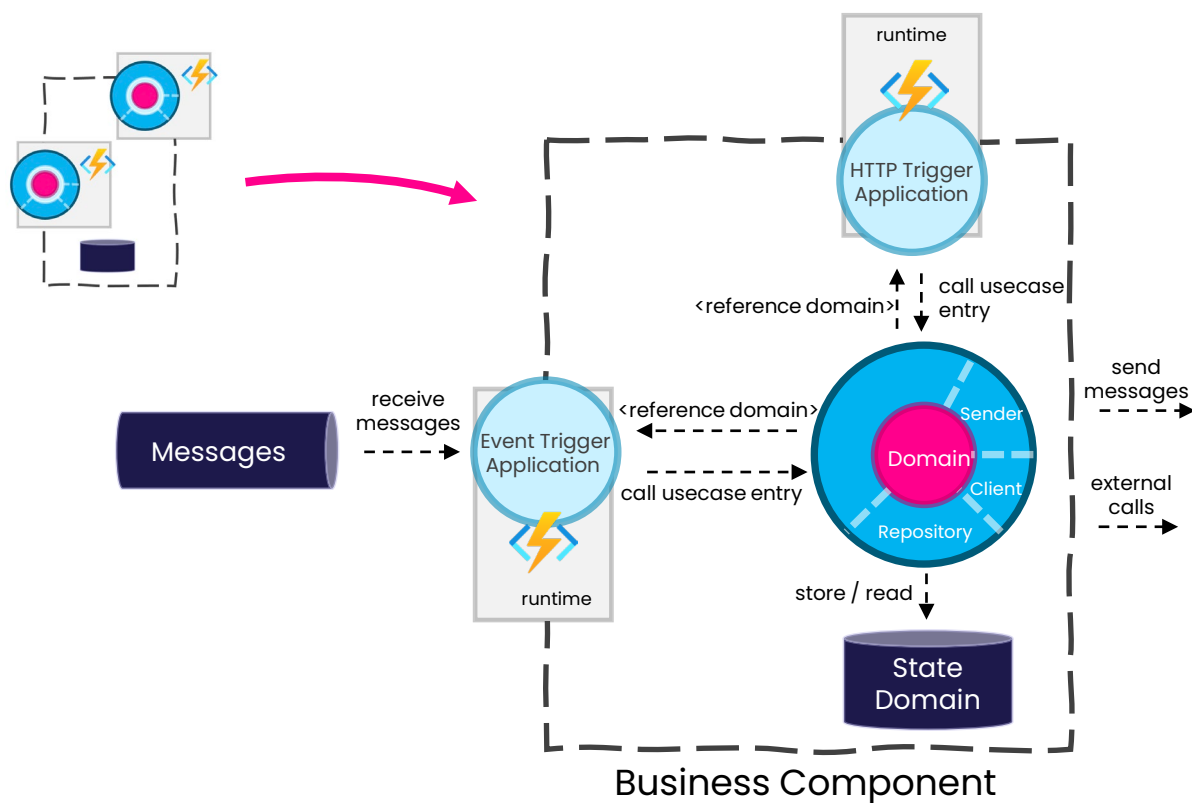

**No cross
component
data
access**

**Only *async*
communication
between
components**

Domain driven components on fine grained Application Architectures

Design microservices with event triggered Applications

Build a **single domain core** for every business component as library

Split Domain core from **Application Layers**

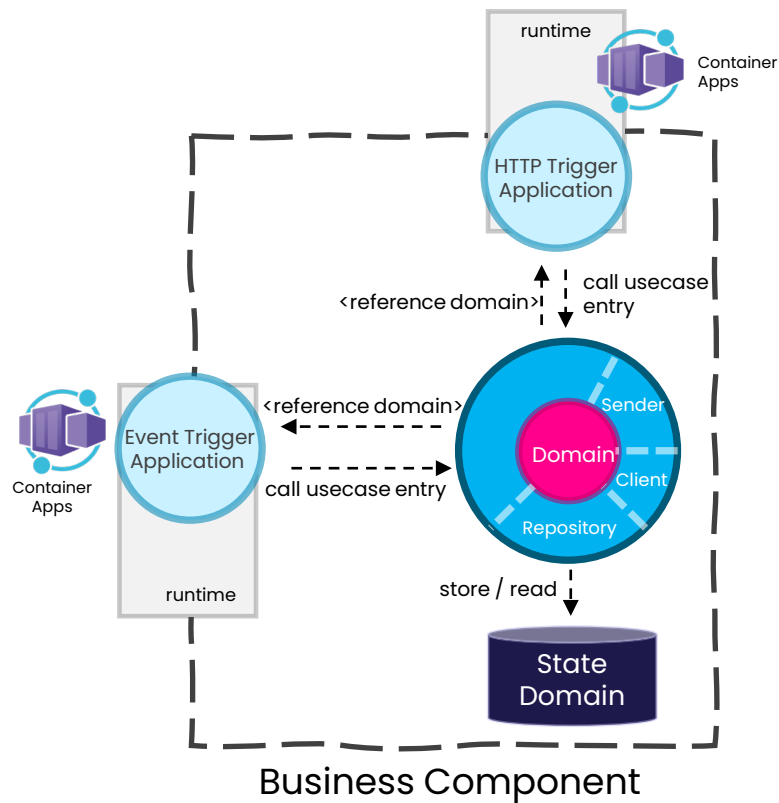

The Application Layer is just an **entrypoint**

Scaling is still optimized **per Trigger Event**

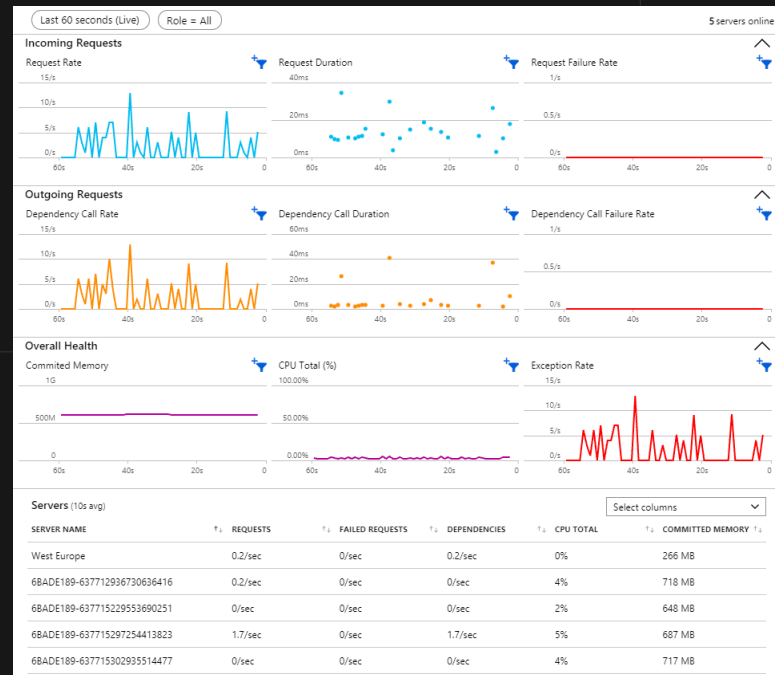

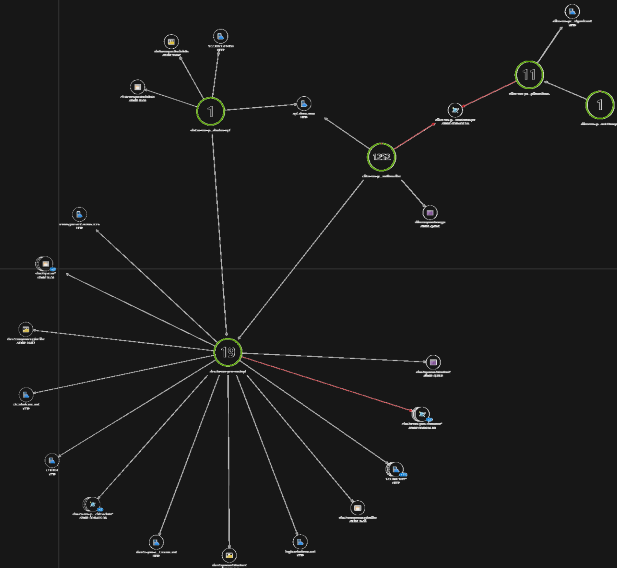

Domain driven components on fine grained Application Architectures

It works very well with other serverless runtimes

Observability

Cost management in serverless
